### CITP / Auto Patch- Tech Note

The Axon HD, HD Pro, DLHD and MMS support the Auto Patch feature released in HOG OS 3.6.0. To use this feature **AND** use multiple outputs on an Axon HD or HD Pro server, 10 layers must be selected in the CMA drop down. This allows the Auto-Patch feature to properly align the start channels of each output and the start channels of each layer. Further development work will be undertaken to allow fewer layers to be used and allow the auto-patch feature to function properly. If only one output is to be used, make sure the start channel on the Graphics server is set correctly, this start channel can be found in the patch window.
